Segmented Button Panel

Used as a set of related buttons arranged together, where each button can be selected individually. Only one button in the panel can be active (pressed) at a time, and clicking on a new button deactivates the previous one.

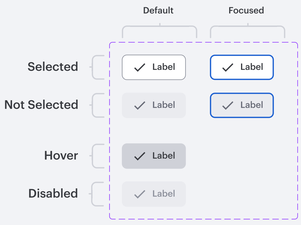
Use Instance Of This In Your File

Segmented Button (Nested Component)

DSM Building Block: Do Not Use

Review this section to understand states of buttons nested in the parent segmented button panel component



Hide or Unhide Icon

Some use cases may feature an icon that represents the action or function associated with the segment text. In other cases, a segment may omit icons and rely on text labels alone or may omit text and rely on icon alone.

OPTIONAL GUIDANCE BLOCKS

Do:

Use Segmented Panel to switch between different view modes or settings within a small subset of choices (e.g., merchant table view vs group table view or grid vs column view of a table)

Don't:

Confuse Segmented Panel with Tabs
