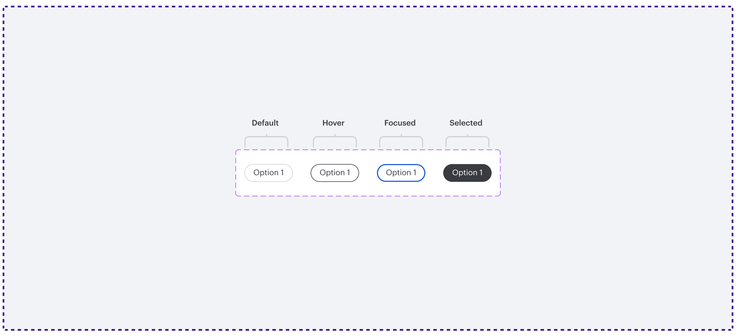
Response Chips

Response chips are interactive elements used to represent quick, concise responses or choices in a user interface. Ideal for chat interfaces, forms, and situations where users need to make quick selections or provide responses.

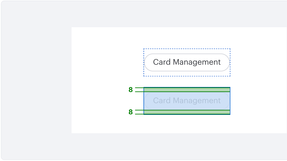
Main Component

Use Instance Of This In Your File



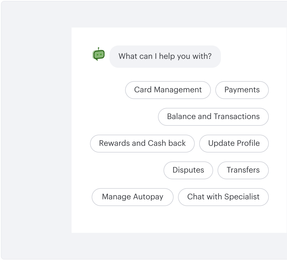
TOUCH TARGET

The recommended minimum touch target is 44x44 px. It is suggested to maintain 8px tap area around the component. This ensures that the touch target is enough for users to interact comfortably, especially on touch screens.

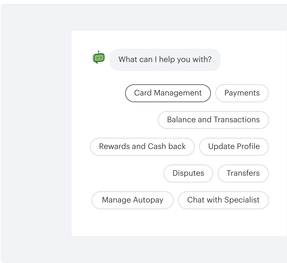


VARIATIONS

Default Interaction



Hover Interaction



Focus Interaction

Response chips can be navigated using the **Tab** key on the keyboard. A blue stroke appears around the chip when the focus state is applied.

GUIDELINES

Do:

Add guidance on how to use a component.

- Use short, clear text on chips when used as chip groups to ensure readability and avoid truncation. Aim for under 20 characters.
- Ensure all chips in a group have consistent height and padding to create a uniform appearance.
- Provide adequate space between chips of 8px to prevent accidental selection and maintain a clean layout.
